

Features

- Sensitive Enough To Detect Run-off Changes In Groundwater Tritium Plumes
- Low Level Real Time Continuous Tritium-in-Water Monitor
- Optional: Capture & Hold Sampling System
- 6 Port Intake Manifold for Sampling 6 Individual Input Lines, Sampled in Series
- Tritium Only; Ignores Other Nuclides
- Sensitivity of 13,500 pCi/l in 8 Hours
- 6,750 pCi/l Detectable in 24 Hours
- No LSC Fluid / No Waste Product
- Full On-board Computing System for Data Acquistion, Analysis, Archiving & Retreival

Automated Flow Thru Tritium Water Monitor

Model - Trimaran - H₂0

- USB, Optional 4-20 mA
- Easy Integration linto Facility Mainframe
- User Settable Units, Alarm Limits, Flow Rate, Etc.
- Rugged, Reliable, Simple Operation
- Steel Frame Mounted
- IP42

Application

Monitoring changes in Tritium concentration in primary and secondary coolant, entering or leaving the Recombiner, make-up pond or spent fuel pool, etc.

Other applications include monitoring Tritium in processed water, storm water, drain effluent, ground water, rivers, lakes, and ocean currents. Eliminates the need for pulling samples manually; waiting on expensive lab results. This automated system frees valuable and expensive personnel for other duties.

Low End Sensitivities

MDA	MDA	MDA	MDA
8 HOURS	24 HOURS	7 DAYS	ONE MONTH
500 Bq/L	250 Bq/L	40 Bq/L	TBD
13,500 pCi/L	6,750 pCi/L	1000 pCi/L	TBD

Model - Trimaran - H₂O

Description

Fully Integrated Package

Model Trimaran- H_20 is a completely self-contained instrument for real time continuous detection of Tritium concentration in water. The instrument is mounted inside a rugged built 200 cm tall steel enclosure with reinforced anchoring feet and locked access.

P-10 gas (90% Argon, 10% Methane, non-combustible) cylinder is connected to the unit externally. This quantity is sufficient for 60 days of continuous operation.

The main subassemblies are:

- 1. Sample water input lines
- 2. Pre-filter
- 3. External cooling loop in case of hot samples
- 4. PRV and RV system with manifolds
- 5. Water purification system (oil-in-water and micron filter)
- 6. Sample water pump
- 7. Detection module
- 8. Data acquisition electronics module
- 9. System control module
- 10. Waste water output line, RV output line and sample bypass output lines
- 11. Sample Enrichment assembly

Pressure Regulating Equipment

Pressure of input sample streams can be up to 103 kPa. The pressure is immediately reduced to 2-3psi via Pressure Regulating Valves (PRV).

Each PRV is associated with Pressure Relieve Valve set to open at 100 kPa, preventing the pressure in the system from being more than 100 kPa, in turn making it safe to handle.

This also makes the instrument Class 6 Nuclear Device.

Low Minimum Detectable Activity (MDA):

- The Trimaran H₂O detects Tritium decay extracting T₂ and H₂ from water, enriching/concentrating the sample.
- Sensitive measurement is made with matched gas flow proportional counters.
- 1/8" lead or equivalent shielding minimizes cosmic and Gamma radiation effects providing low back- ground noise. **Optional** 1/2" lead or equivalent shielding.

Remote Monitoring and Alarming:

- USB, Ethernet and **Optional** 4-20mA output.
- 2 alarm outputs and malfunction outputs in the form of dry, fail-safe, relay contacts.
- Alarms are user adjustable.
- Malfunction alarms activate in case of electronics and/or mechanical failures in the system.

Model - Trimaran - H₂O

PLC Control

- Sampling of input lines and control of alarms and pumps is done by PLC unit placed inside of the System Control Module.
- An alarm and a manual override are provided in case of PLC failure providing manual operation until PLC is replaced.
- Manual operation is a backup system; the unit normally operates in automatic mode.

Routine Maintenance

Scheduled maintenance of consumables is required

P-10 gas cylinder needs to be replenished every 2 months

Sample air filters need to be replaced when needed

Periodic check of the efficiency & background is recommended if there is a possibility of increased background contamination and due to standard life cycle of electronics components

Annual Inspection And Service

It is recommended that the instrument be inspected and serviced on an annual basis to ensure continuing trouble free operation. All components of the instrument should be inspected and instrument re-calibrated.

Repair

Equipment failures of a minor nature can be repaired under local supervision by the operator of the equipment. When necessary, the manufacturer (Technical Associates / Overhoff Technology), or its agents can dispatch service personnel for quick remediate action.

Documentation

All Technical Associates / Overhoff Technology equipment is accompanied by complete documentation, which includes the following:

- 1. User and Maintenance Manual that contains:
 - a) Theory of operation
 - b) Installation instructions
 - c) Operation instructions
 - d) Calibration procedure
 - e) Suggested maintenance
 - f) Repair instructions
 - g) Drawings, diagrams and schematics

Training will be provided by the manufacturer, at this factory, free of charge. Assistance with commissioning is also available by the manufacturer (Technical Associates / Overhoff Technology).

Advantages of Proportional Counting System Versus Liquid Scintillation

Prior to the development of the Trimaran H₂O, the only detectors capable of measuring very low levels of Tritium in water were Liquid Scintillation Counting (LSC) based. The LSC approach has some obvious disadvantages, such as: the LSC fluid must be constantly refilled at a significant cost in labor, money, and space; LSC fluid is also hazardous material and mixing with tritium results in 'liquid mixed waste,' which must be carefully stored, transported and disposed of.

The **Trimaran H₂O** utilizes proportional counting technology. A compact standard steel tank of proportional gas will last for more than a month and is readily available from a variety of suppliers.

The P-10 counting gas is 90% Argon and 10% Methane, is not toxic or combustible.

Measurement with this method achieves same or better low-end Tritium sensitivity, without having to deal with LSC fluid and waste.

The Trimaran H₂O has a 6 port intake manifold for sampling 6 individual input lines, sampled in series.

Sample Enrichment

With LSC and proportional counting detectors, Technical Associates / Overhoff Technology has pushed Tritium detection to the most sensitive limit.

Samples can be diluted even with large multi-liter detectors there are not enough disintegrations per second for good measurements. This issue is overcome by concentrating or enriching the sample.

This may be accomplished using iterative processes to concentrate the Tritium in water using phase change or other physical differences (not chemical processes since 1H, 2H, and 3H are chemically identical.)

Technical Associates / Overhoff Technology scientists have developed their own proprietary sample enrichment cycle, creating system sensitivities far beyond other automated flow-through systems

Electronics and Measurement Specifications

Measurement Range:	0 kBq/L — 130 kBq/L	
Sensitivity:	See Chart	
Detectable Limit:	40 Bq/L (in 1 week) at confidence level of 95%	
Display:	LCD Touch Screen Monitor	
Units:	User Settable	
Measurement Method:	Gas flow proportional counters	
Proportional Counters:	Dual copper clad acrylic counter tubes, 2 liter active volume, 2.5 liter wetted	
	volume, 0.001 inch tungsten collector anode	
Counter Gas:	P-10 or "MAGIC" gas for high performance	
Flow Rate:	250 cc/min, typical - Continuous Flow is Standard	
	OPTIONAL: Capture and Hold Sampling	
On Board Computer:	Data-analysis, Archive, Retrieval	
Output:	USB and Ethernet OPTIONAL 4-20mA	
Signal Processing:	Electronic signal processing of coincident pulses for Tritium specific wave	
	shapes (height and duration)

Model - Trimaran - H₂O

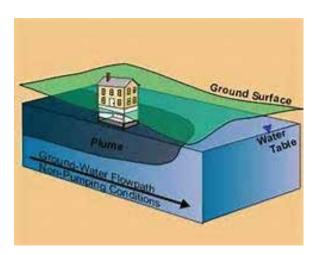

Electronics and Measurement Specifications

Sampling System: See Diagram

Environmental:

0° C to 50° C		
0 to 95 % R. H.		
Withstands modest shock		
Equipment to be sheltered from exposure to raw elements.		
Power 110/230VAC, 10A main power, +24VDC for 4-20mA and connections for the remote		
alarms and monitoring		
Weight and Dimensions:		
31.5" W x 23.6" D x 84" H (800mm x 600mm x 2133mm)		
1100 lb (~500 kg)		
Self-contained, mounted on a steel frame with lifting eyes for easy transport.		

Sensitive Enough To Detect Runoff Changes In Groundwater Tritium Plumes
